SAMPLE REPORT

Computerized Analysis of Polypeptides Resolved by 2D Electrophoresis and Western Blotting for sample:

*K12 MG1655 E.coli versus
Cygnus Goat anti-E.coli HCP antibody (Cat # AP117)*

Prepared for: Kendrick Laboratories, Inc

Report Prepared by: Christina Rose Date: 3/5/14
Christina Rose, 2D Analyst, Kendrick Labs Inc

Approved by: Matt Hoelter Date: 3/5/14
Matt Hoelter, Western Blot Manager, Kendrick Labs Inc

Nancy Kendrick Date: 3/5/14
Nancy Kendrick, PhD, QA Manager, Kendrick Labs Inc

Samples Compared:

1. Silver-stained 2D gel of K12 MG1655 *E. coli* (LF 762 #12-13)
vs. western blot film from Cygnus Goat anti-*E.coli* antibody against K12 MG1655 *E. coli* (LF 762 #8)

<u>Page</u>	<u>Contents</u>
2 - 5	Images showing spot differences and sample overlay of comparison 1 (Figs 1 - 4).
6 - 7	Images showing all spot numbering (Figs 5 - 6).
8 - 10	Images without spot circling (Figs 7 - 9).
11 - 43	Summary table showing spot percentage, pI and MW (Table 1).
44, 45	Methods and pH Gradient.
46	Western blotting checksheet
CD	Containing electronic copies of report, Excel data, and gel images.

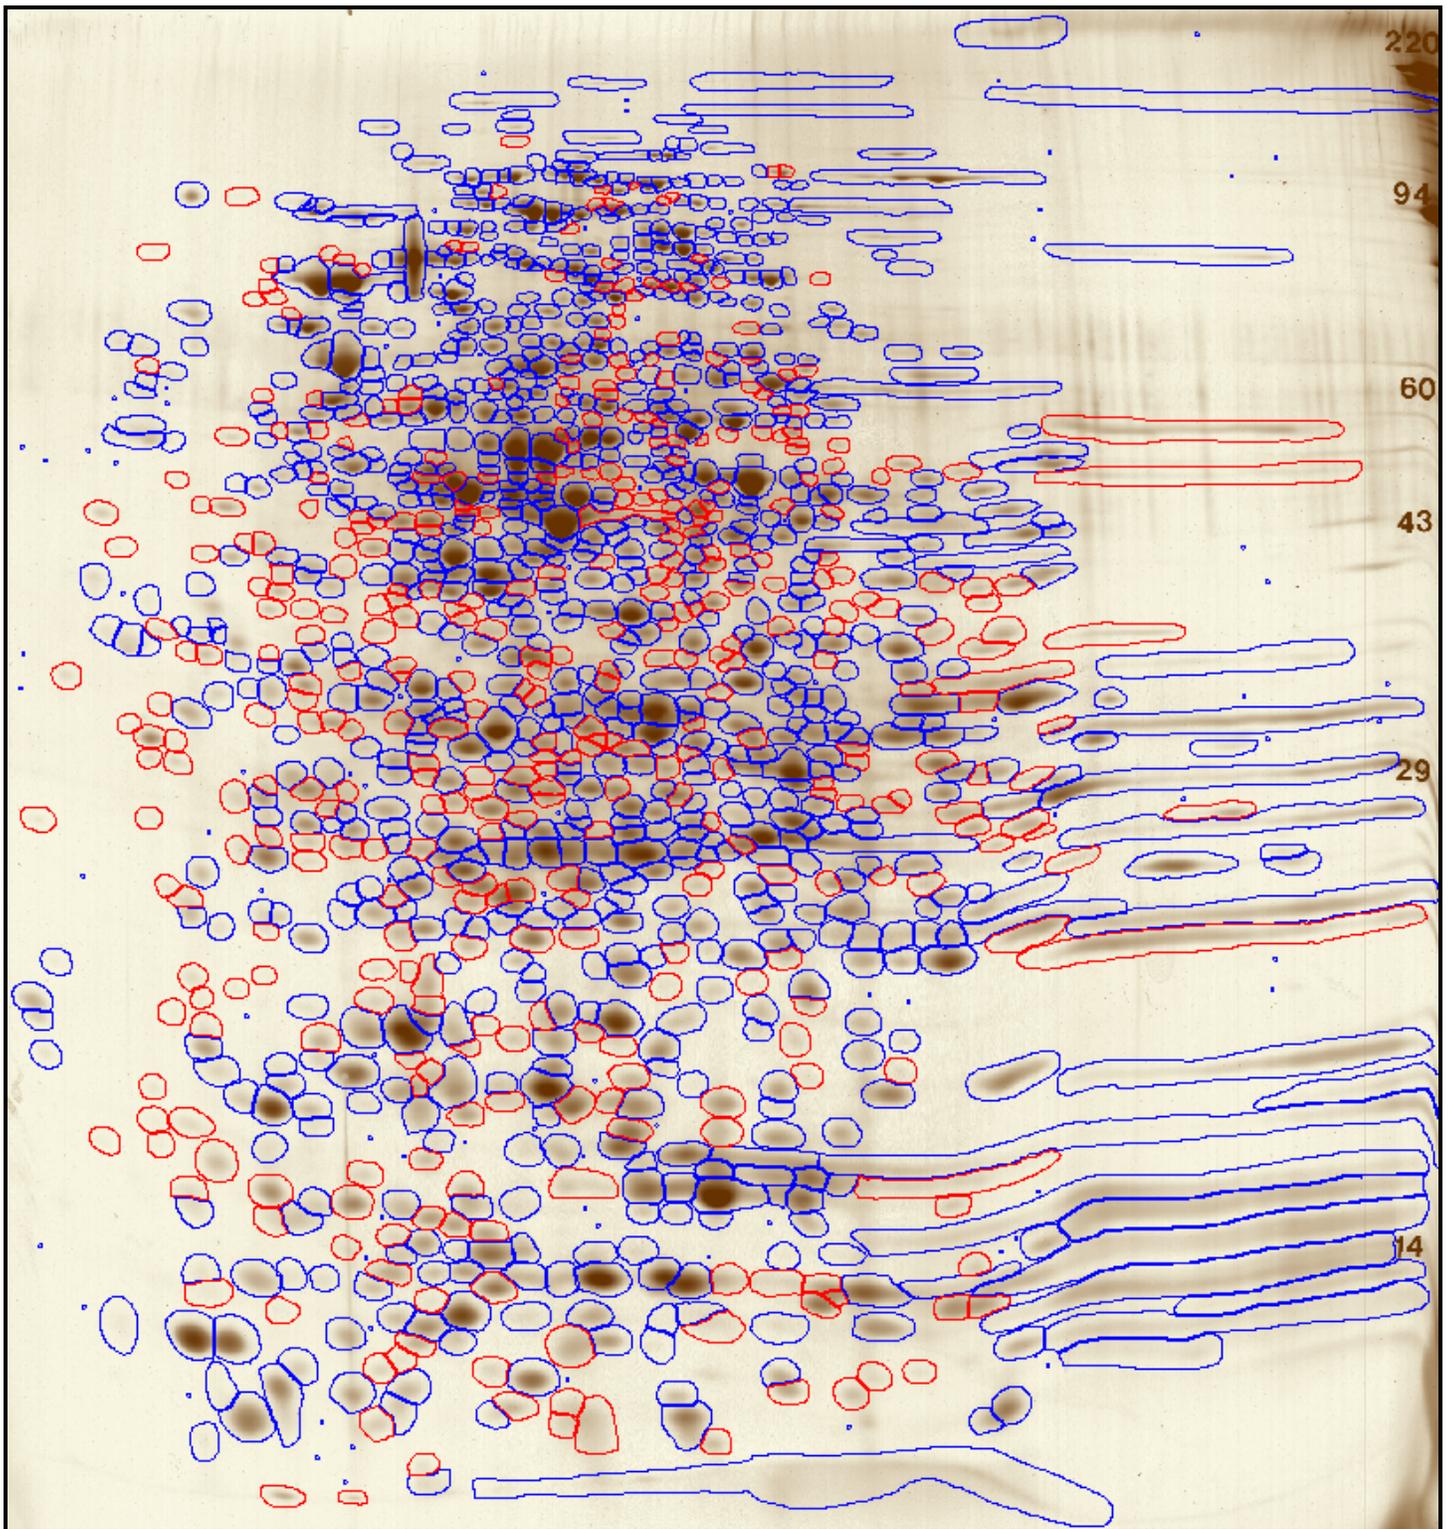

Figure 1. Image of **K12 MG1655 *E. coli*** silver-stained gel (LF 762 #13) showing Cygnus Goat anti-*E. coli* antibody western blot (LF 762 #8) matches. Spots present on the silver-stained gel but missing from the western blot are outlined in **red**. Spots present in both the silver-stained gel and the western blot are outlined in **blue**. Spots detected with the antibody but not detectable by silver staining are indicated with small blue dots on the silver-stained gel and added to the total spot number. The Cygnus Goat anti-*E. coli* antibody detected **993 spots out of 1400 spots (71%)** found. Spot numbering is provided in Figures 5 and 6; spot data is provided in Table 1.

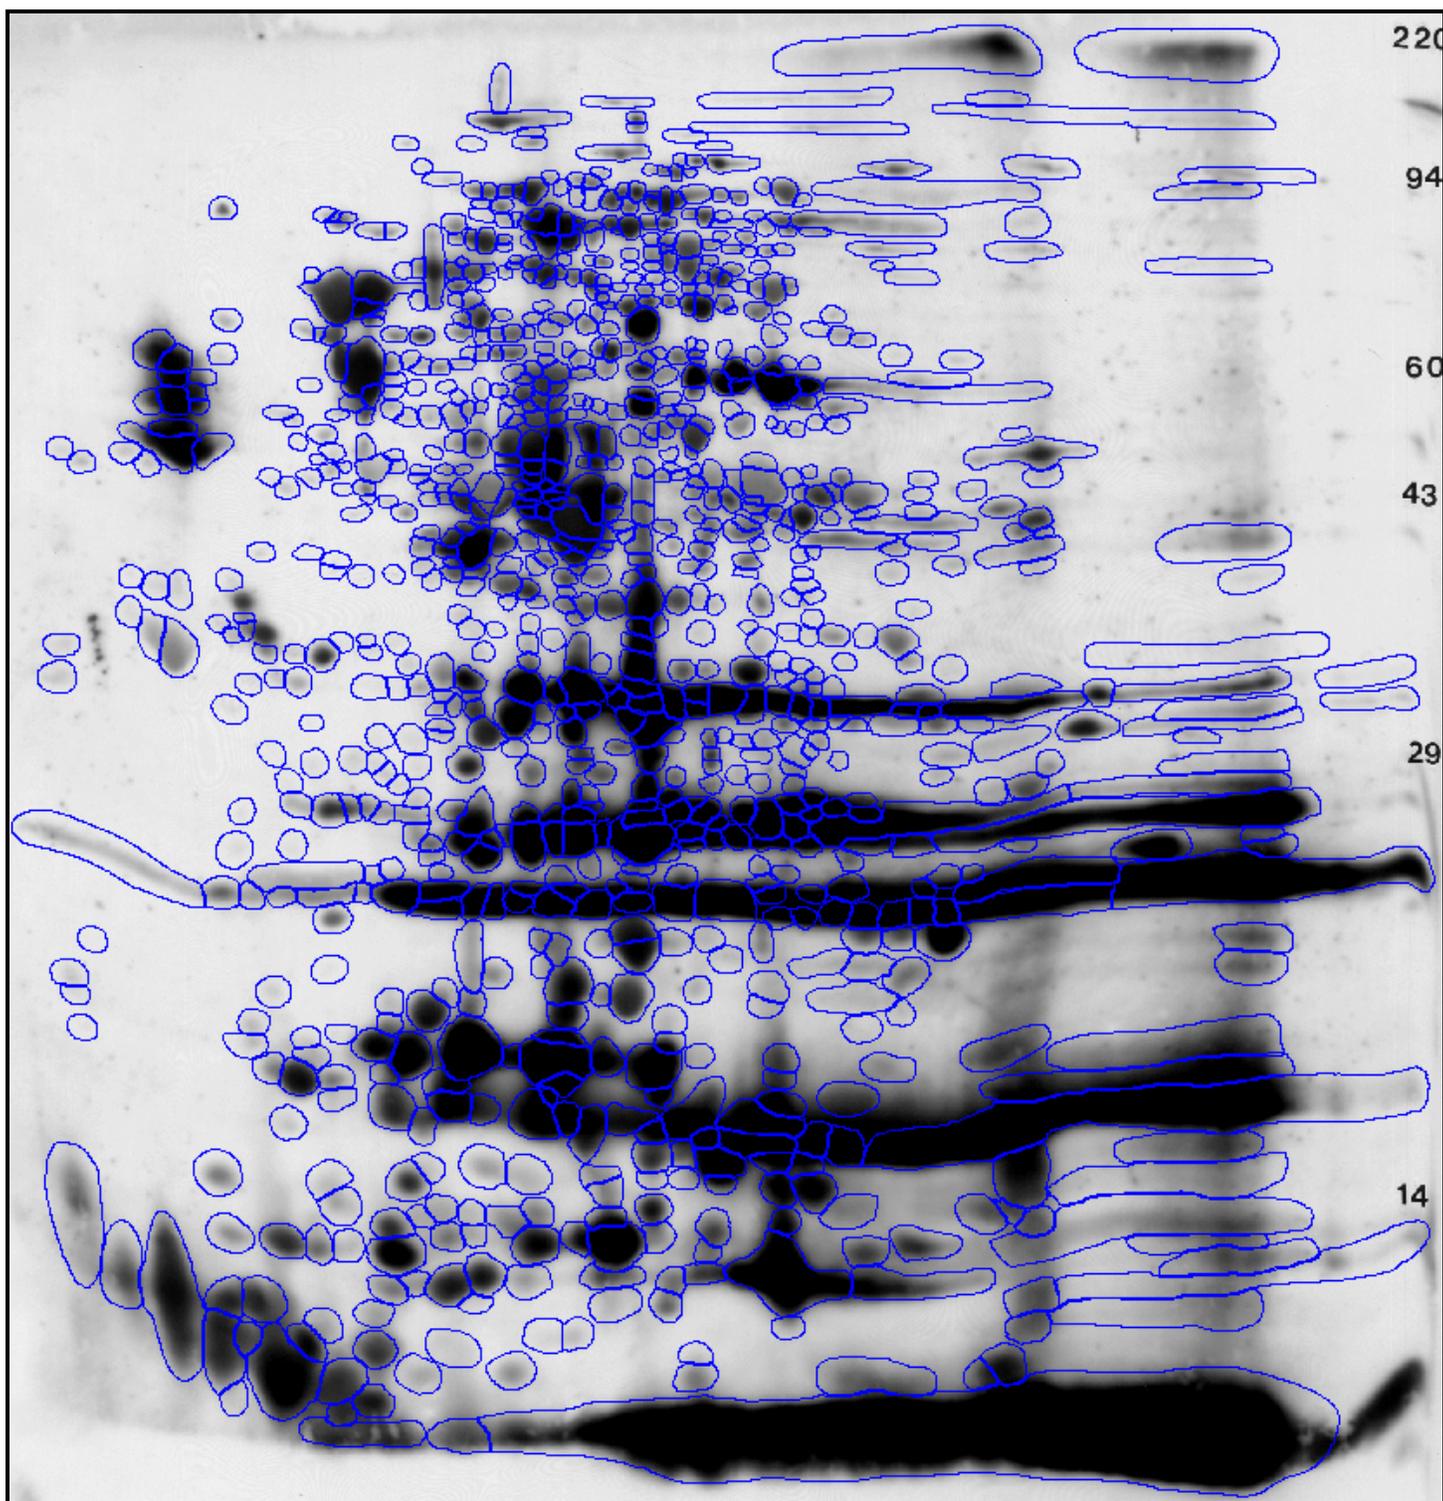

Figure 2. Dark western blot film image of Cygnus Goat anti-*E. coli* antibody against K12 MG1655 *E. coli* (LF 762 #8, 3 minute exposure). All spots detected on the dark and light exposures of the western blot are outlined in **blue**. The Cygnus Goat anti-*E. coli* antibody detected **993 spots**. Spot circling of the overexposed areas of the film can be more clearly seen on the light exposure film (Figure 3). Spot numbering is provided in Figures 5 and 6; spot data is provided in Table 1.

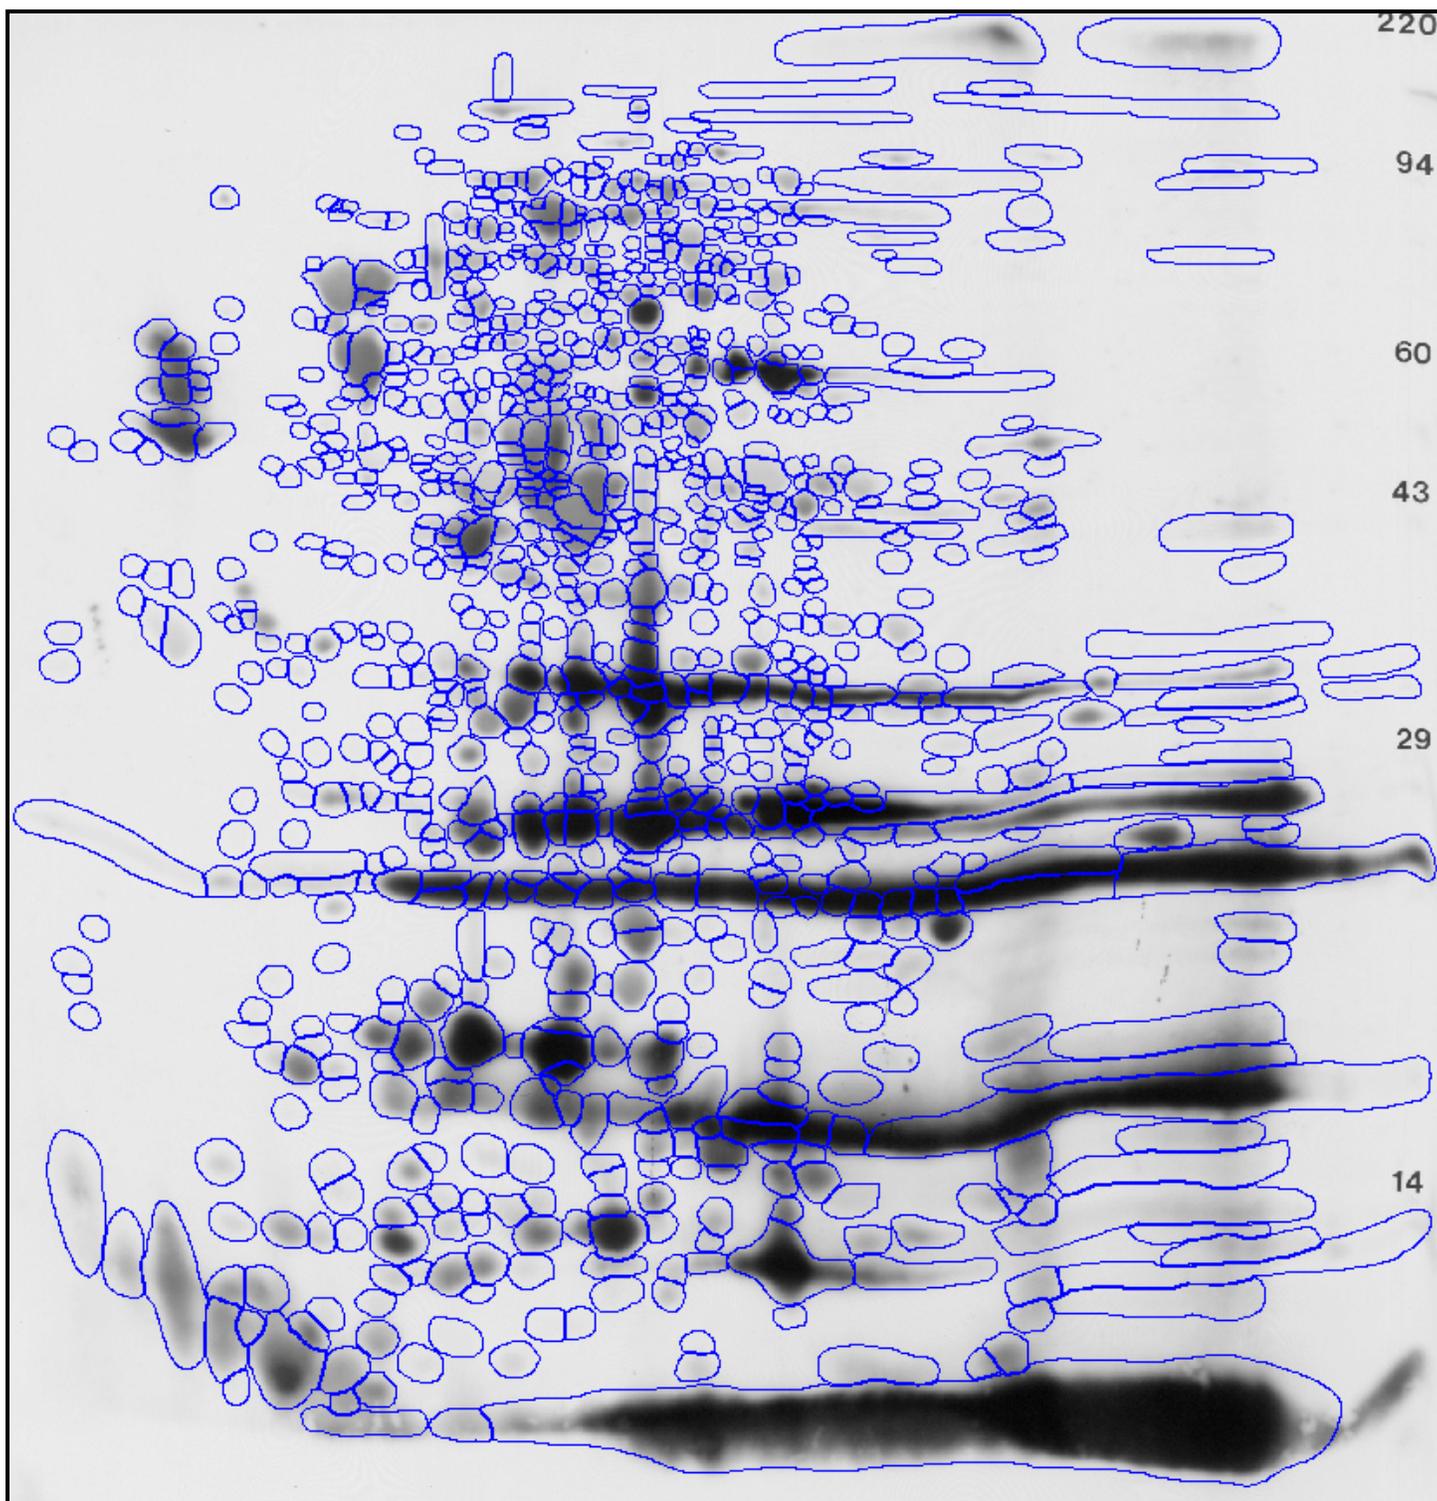

Figure 3. Light western blot film image of Cygnus Goat anti-*E. coli* antibody against K12 MG1655 *E. coli* (LF 762 #8, 1 minute exposure). All spots detected on the dark and light exposures of the western blot are outlined in **blue**. The Cygnus Goat anti-*E. coli* antibody detected **993 spots**. Spot numbering is provided in Figures 5 and 6; spot data is provided in Table 1.

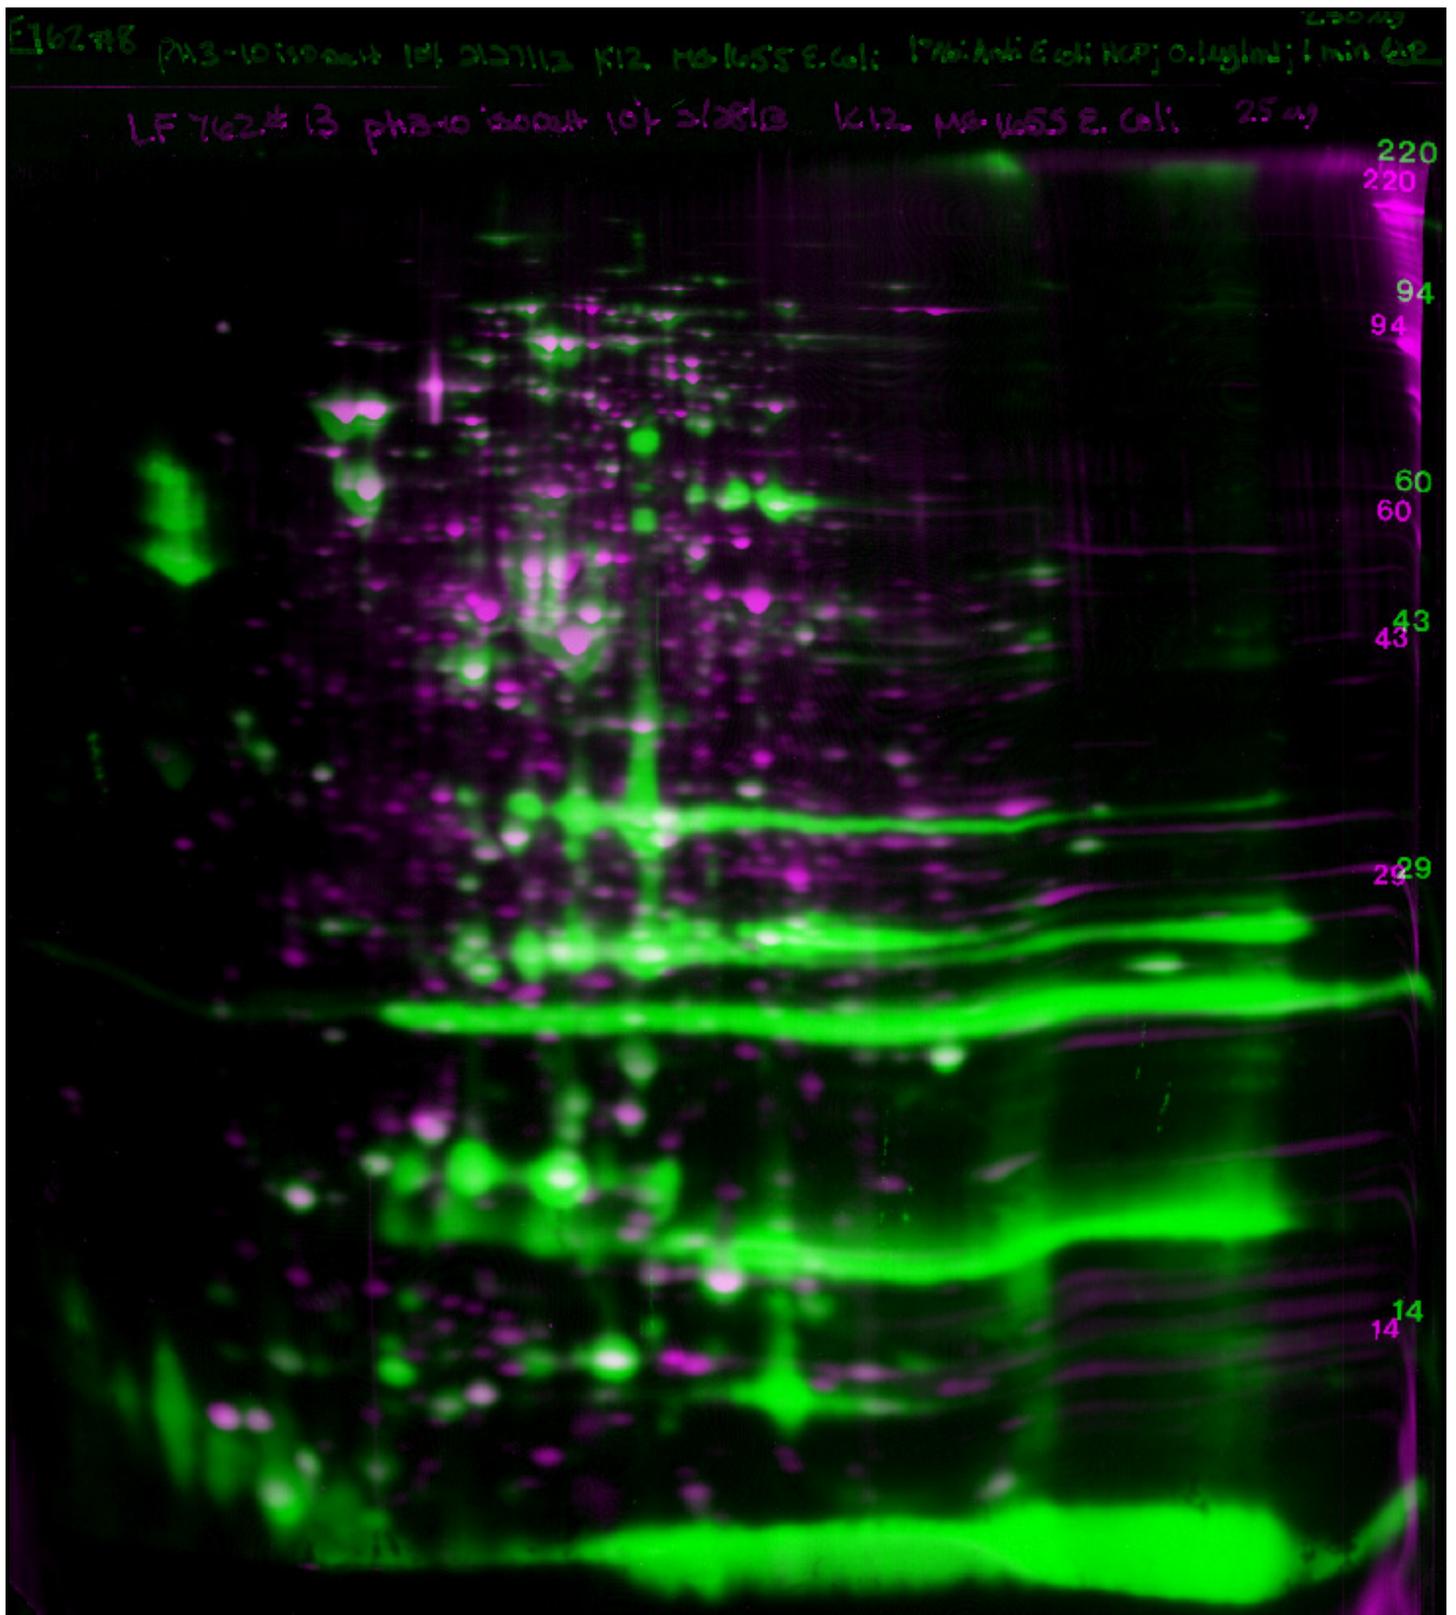

Figure 4. Overlay image showing silver-stained 2D gel of K12 MG1655 *E. coli* (LF 762 #13) in magenta overlaying western blot film image of Cygnus Goat anti-*E. coli* antibody against K12 MG1655 *E. coli* (LF 762 #8, 1 minute exposure) in green. Image appears white where spots of similar intensity overlay each other.

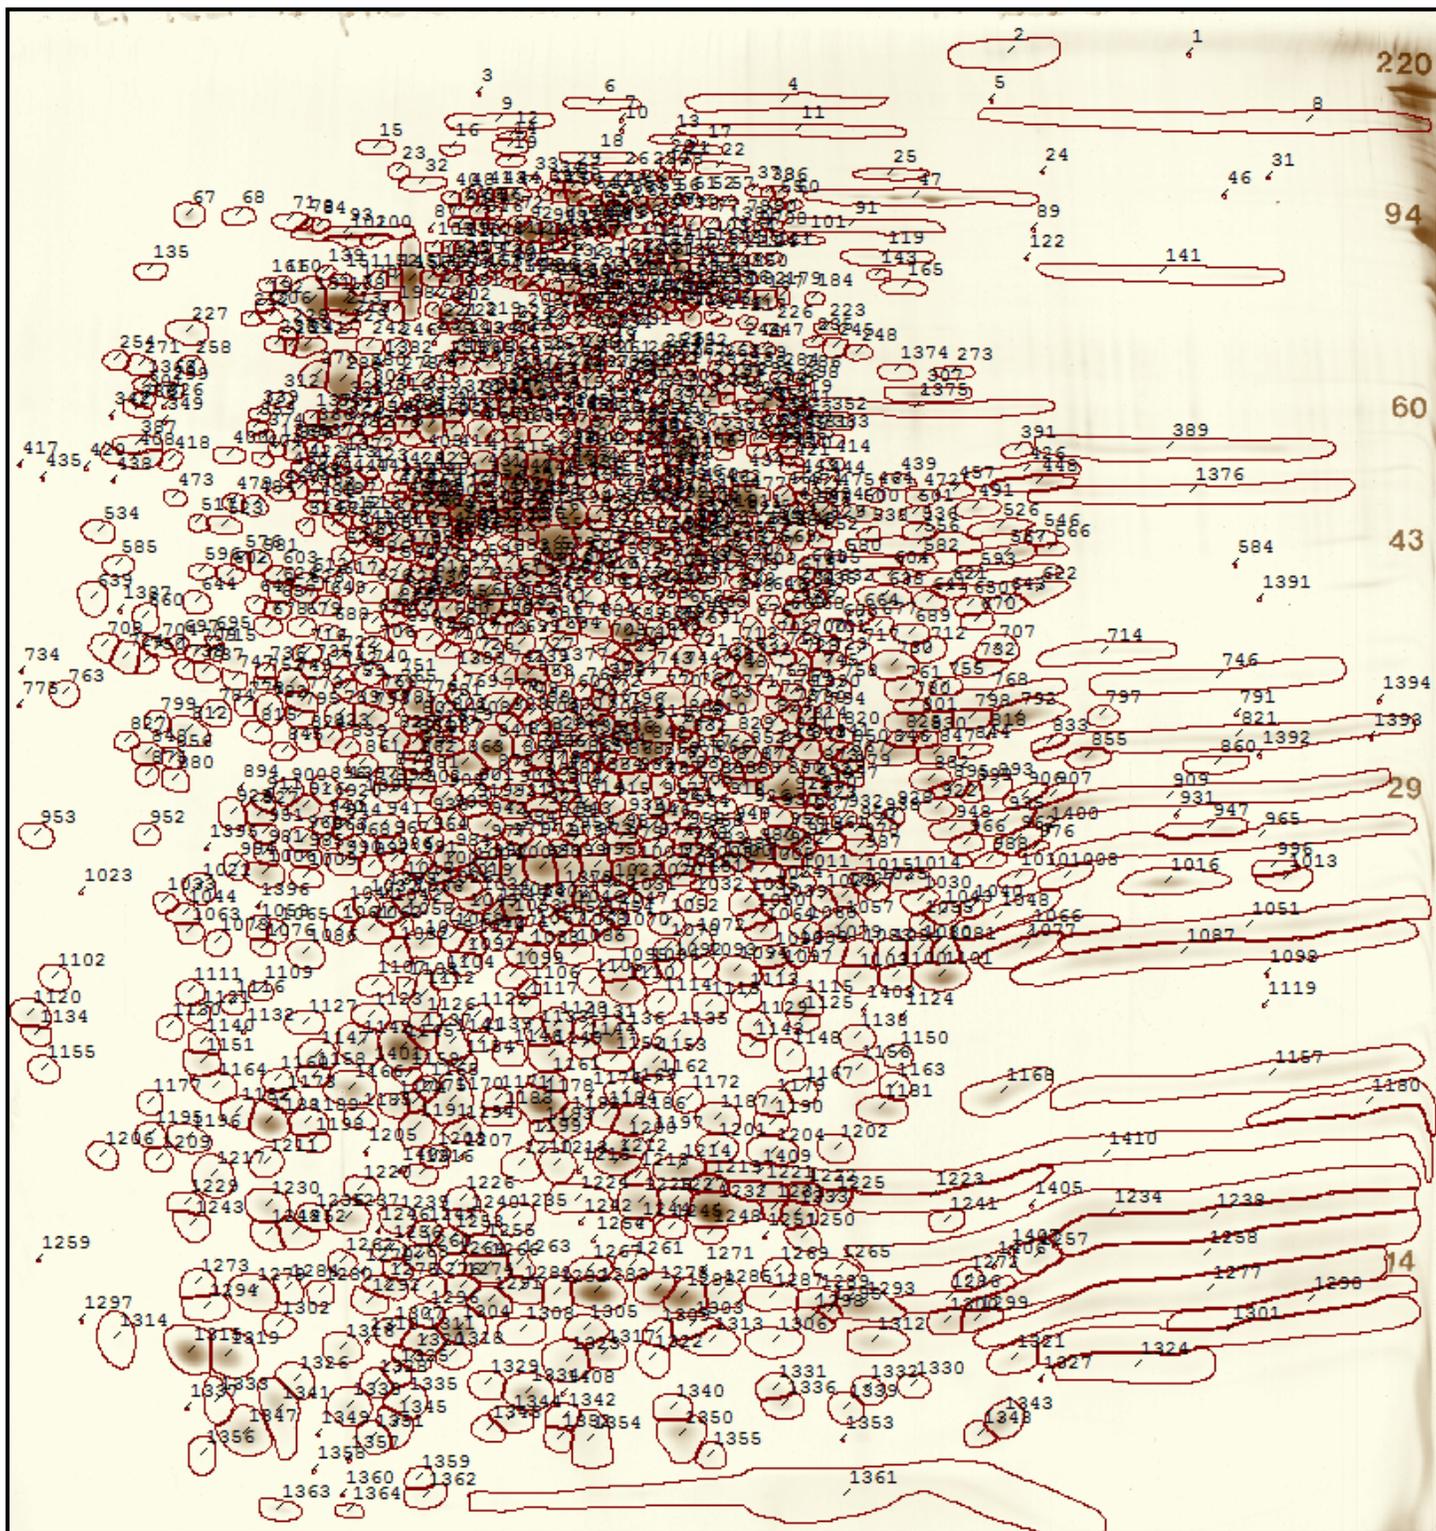

Figure 5. All spot numbering for silver-stained gel image of K12 MG1655 *E. coli* (LF 762 #13). Spots detected with an antibody but not detectable by silver staining are indicated with small dots on the silver-stained gel. Magnified images to show greater detail will be provided on request. Spot data, including pI and MW can be found in Table 1.

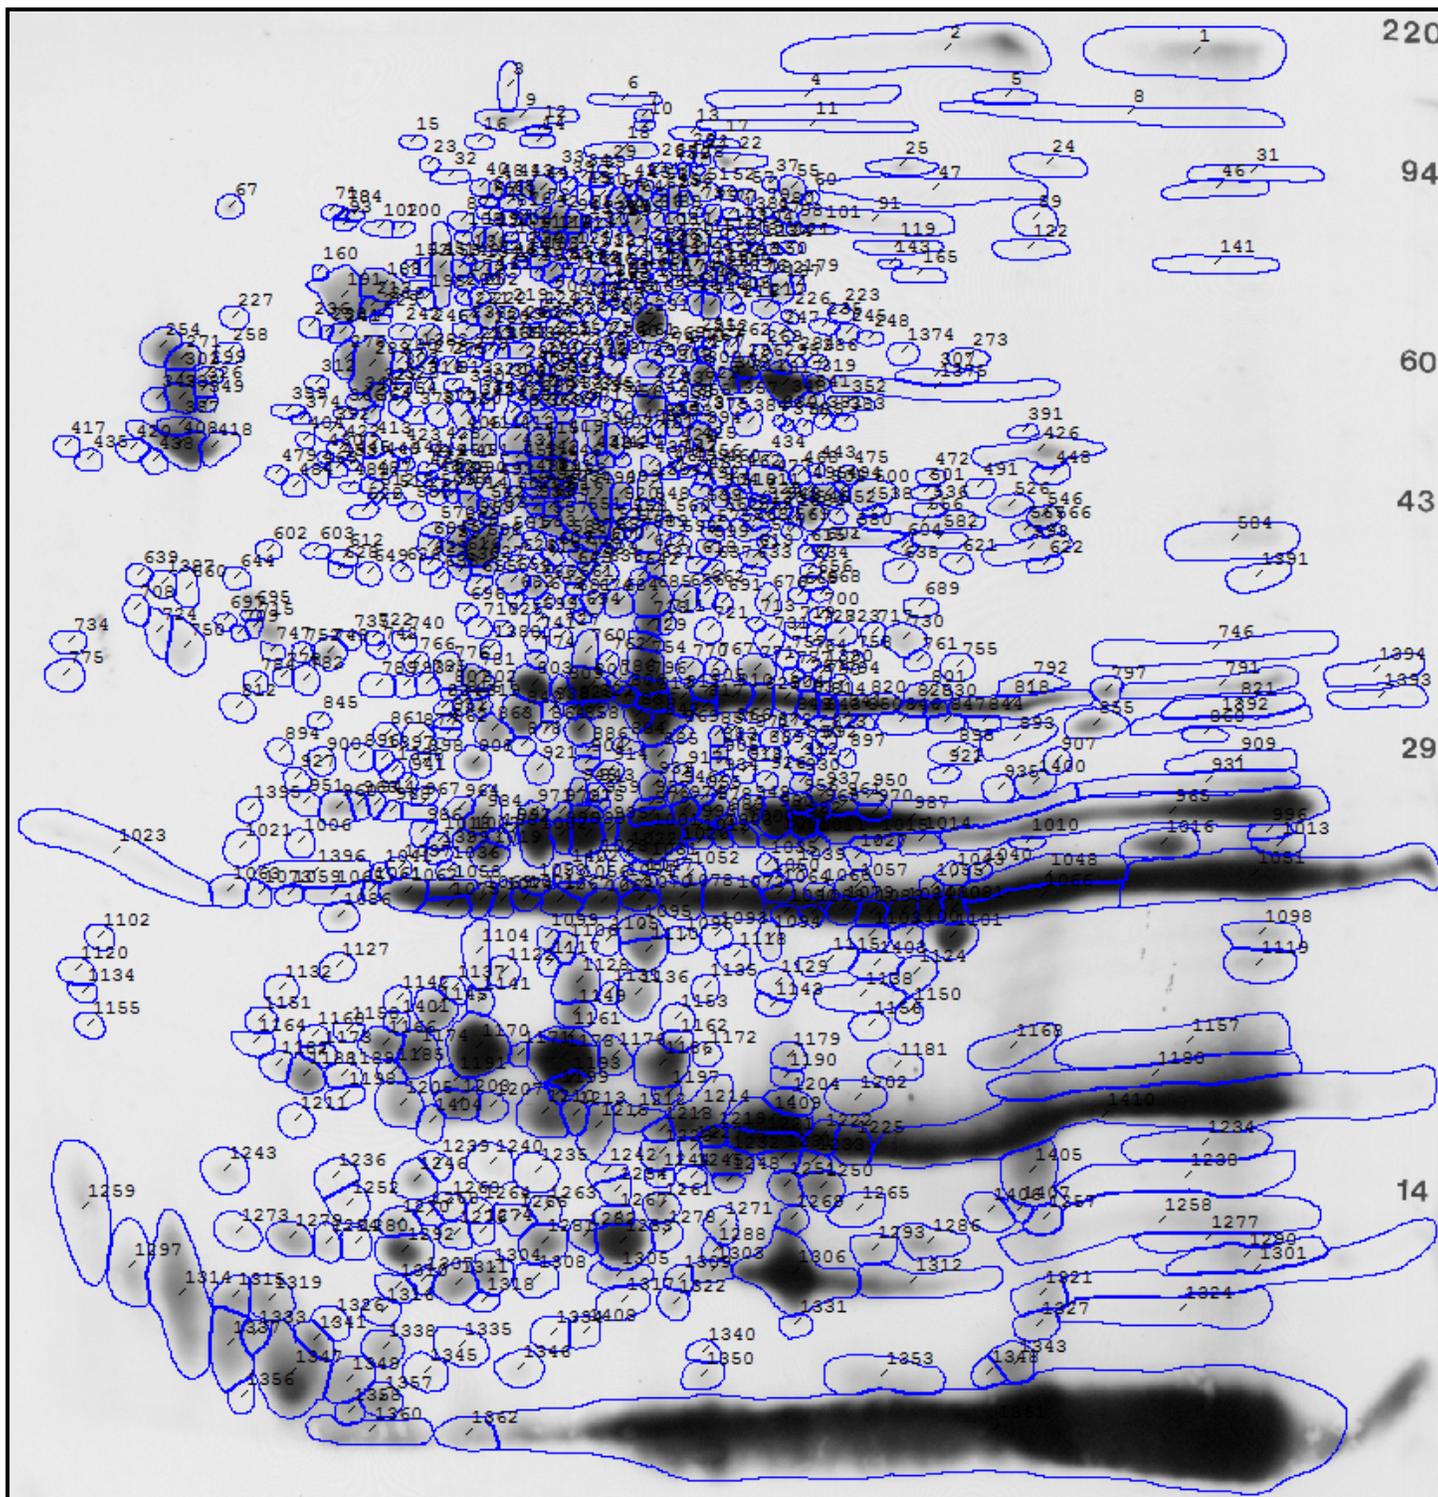

Figure 6. All spot numbering for western blot film image of Cygnus Goat anti-*E. coli* antibody against K12 MG1655 *E. coli* (LF 762 #8, 1 minute exposure). Magnified images to show greater detail will be provided on request. Spot data, including pI and MW can be found in Table 1.

Figure 7. Image of silver-stained gel of K12 MG1655 *E. coli* (LF 762 #13).

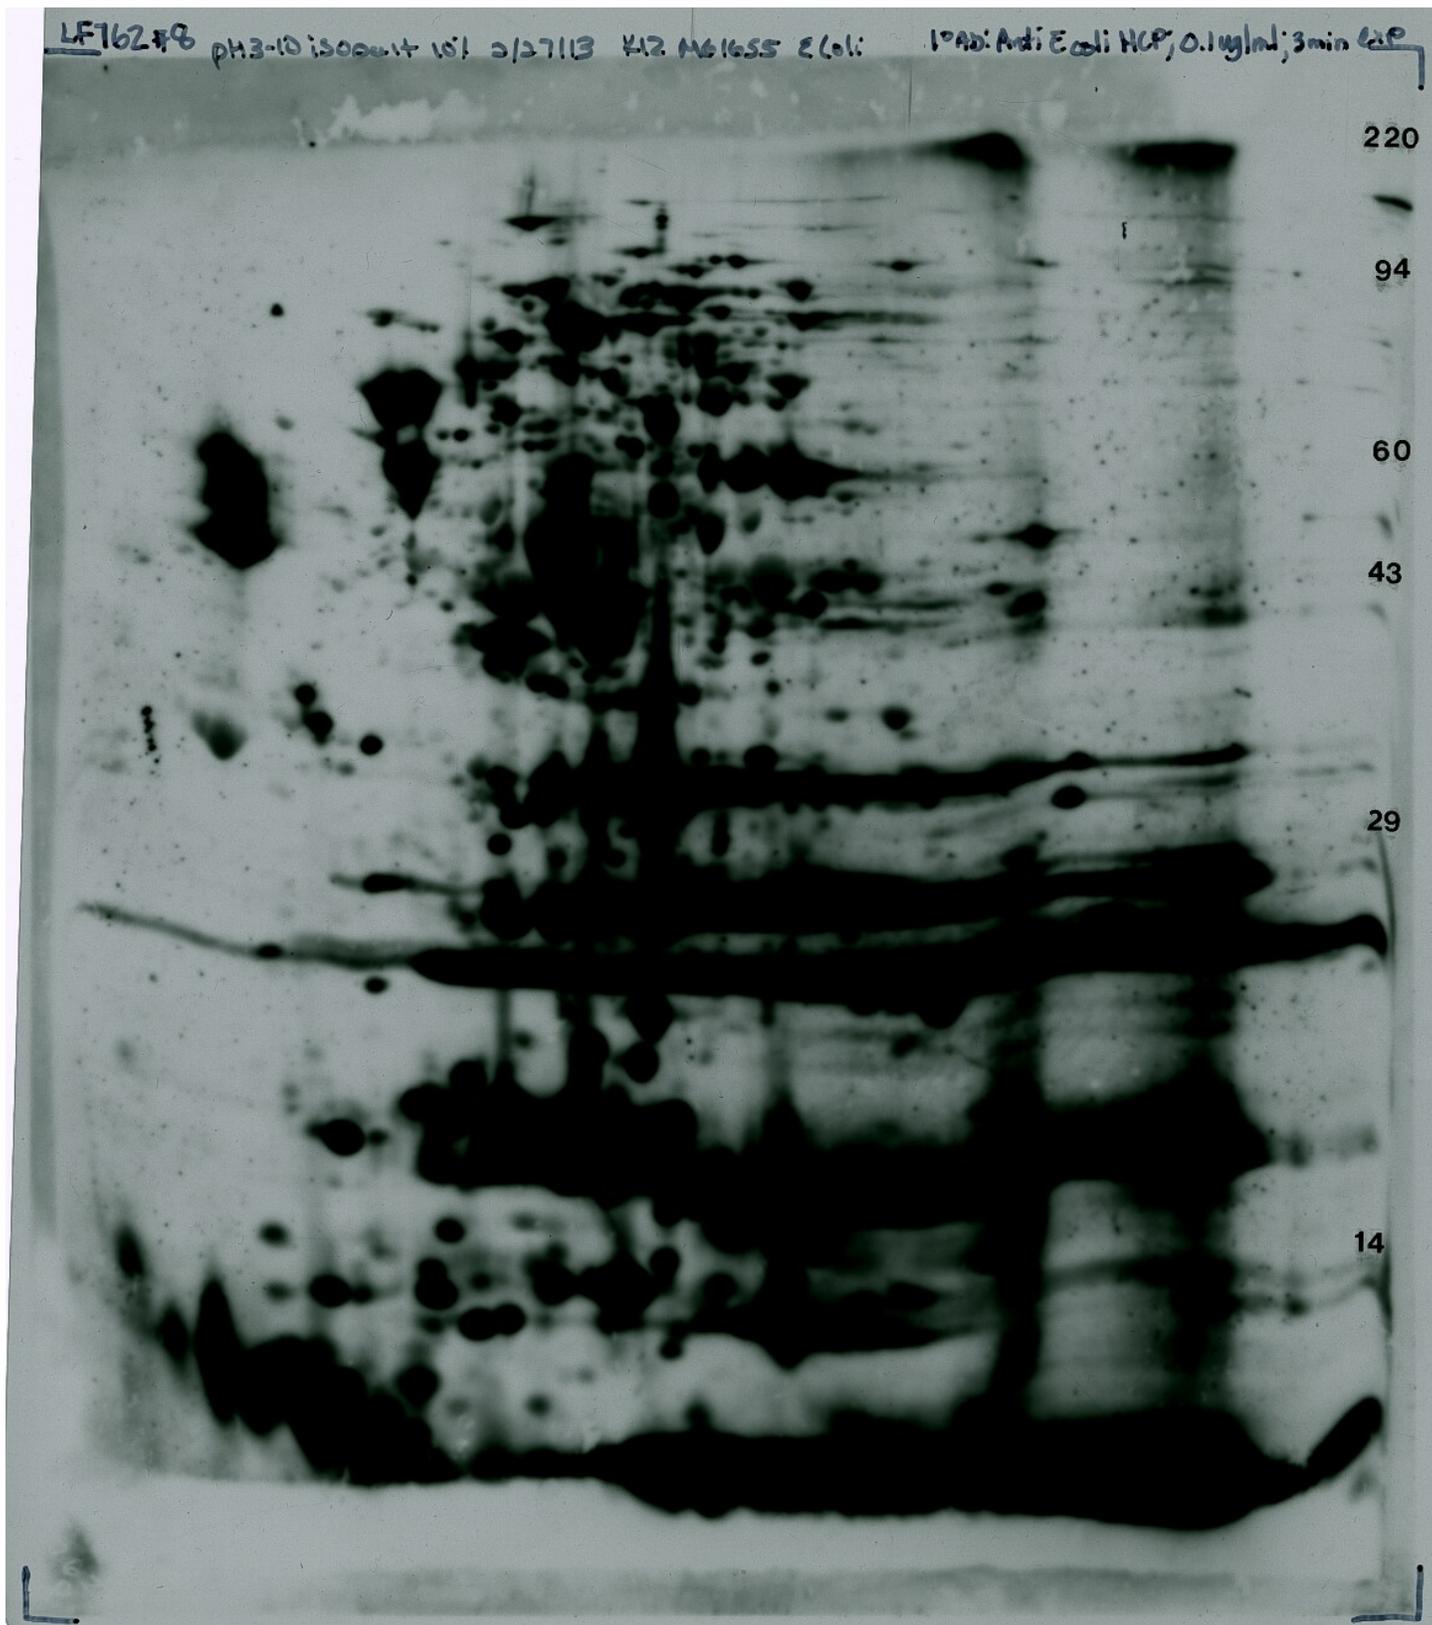

Figure 8. Dark image of western blot film Cygnus Goat anti-*E. coli* antibody against K12 MG1655 *E. coli* (LF 762 #8, 3 minute exposure).

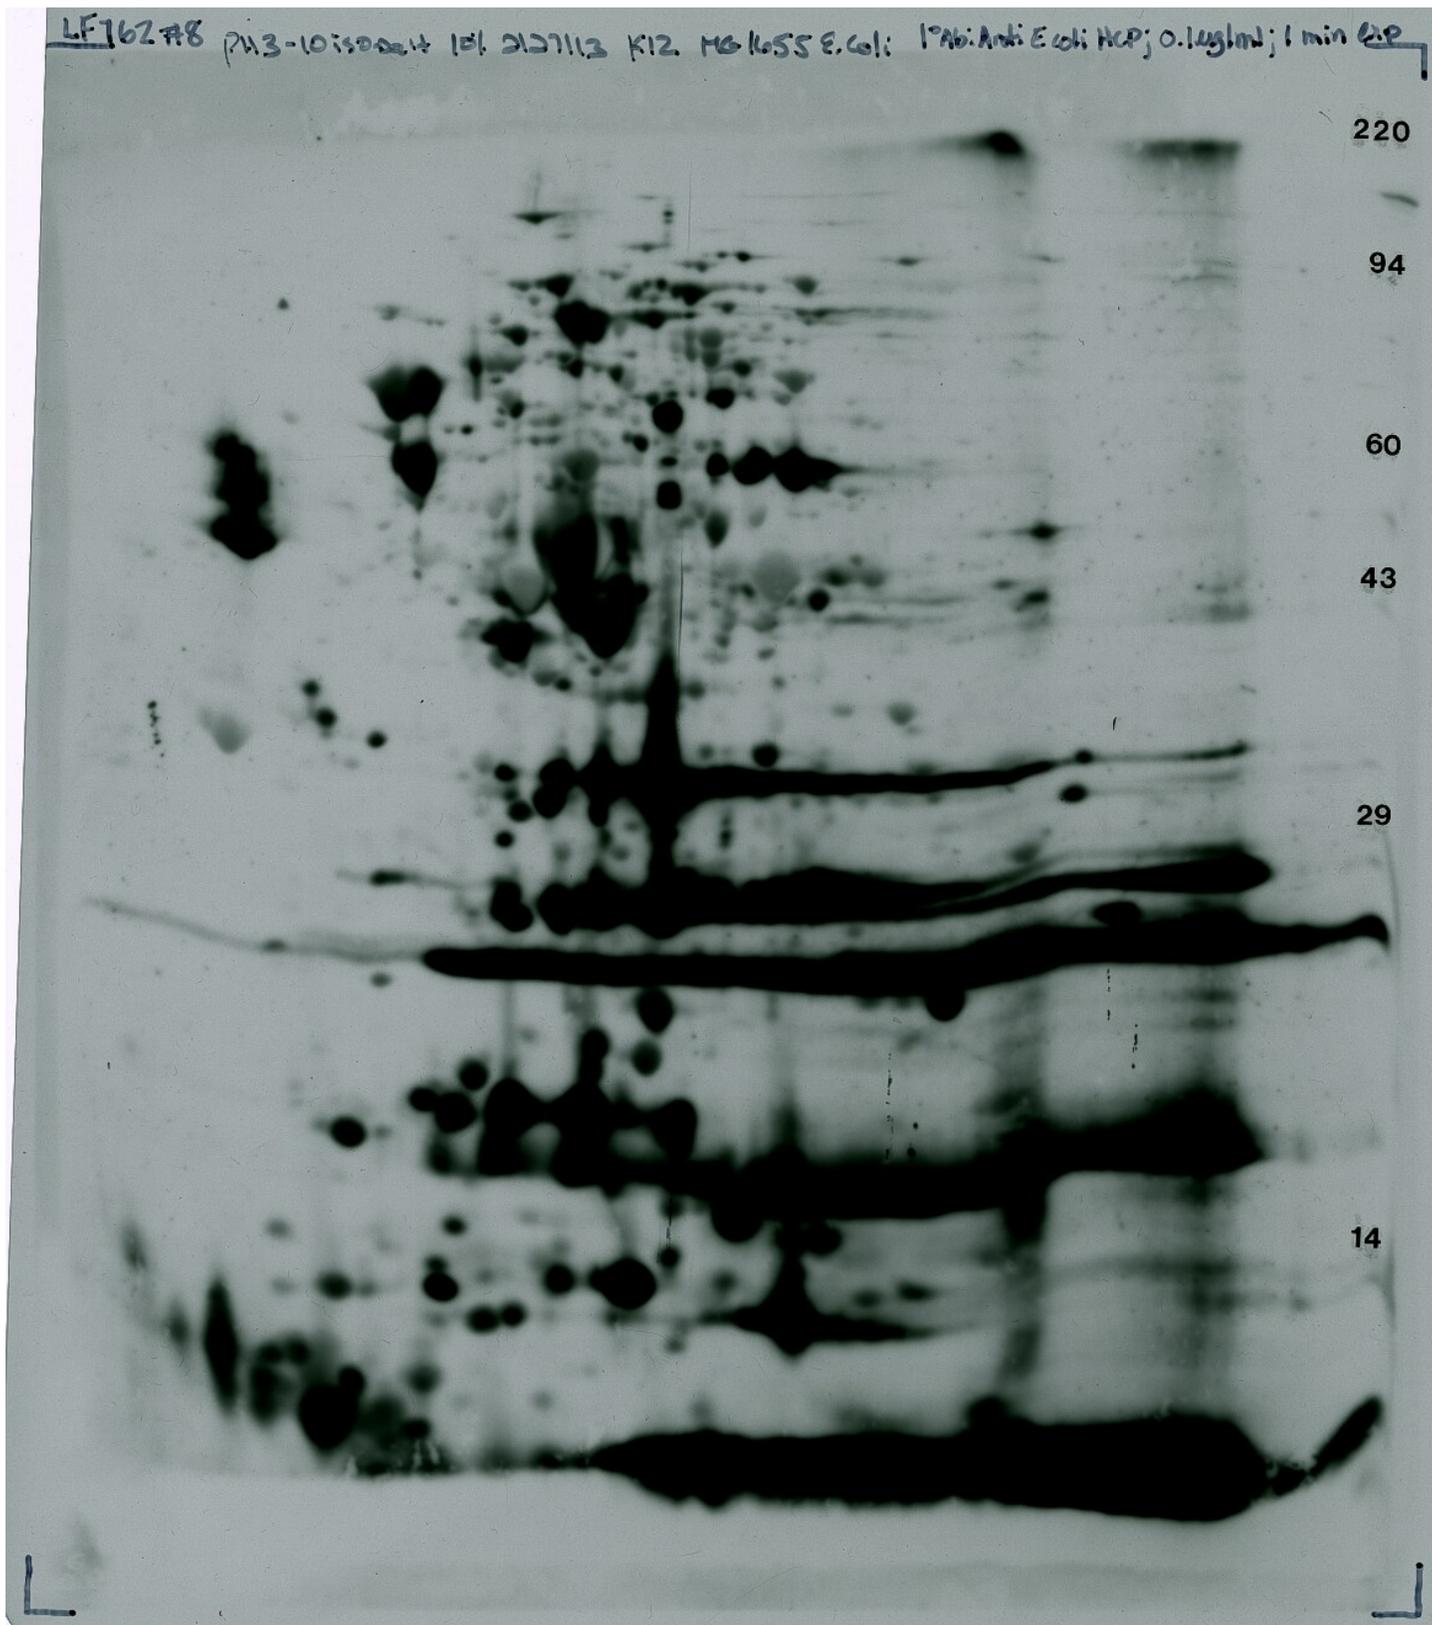

Figure 9. Light image of western blot film Cygnus Goat anti-*E. coli* antibody against K12 MG1655 *E. coli* (LF 762 #8, 1 minute exposure).

Table 1. Summary of protein spot data for 2D gel comparison of K12 MG1655 *E. coli* versus Cygnus Goat anti-*E. coli* antibody. Reference spot numbering, pI, MW, and spot percentage are given for polypeptide spots analyzed in silver-stained gels of **K12 MG1655 *E. coli*** (LF 762 #12-13) and western blot film from **Cygnus Goat anti-*E. coli* antibody** (LF 762 #8, 3 minute exposure). Spot percentages are given to indicate relative abundance. A total of **1400** spots were analyzed. Nd = pI/MW not determined. All spot data is given on the CD.

Materials and Methods

Two-dimensional electrophoresis was performed according to the carrier ampholine method of isoelectric focusing (O'Farrell, P.H., *J. Biol. Chem.* 250: 4007-4021, 1975; Burgess-Cassler, A., Johansen, J., Santek, D., Ide J., and Kendrick N., *Clin. Chem.* 35: 2297, 1989) by Kendrick Labs, Inc. (Madison, WI). Isoelectric focusing was carried out in a glass tube of inner diameter 3.3 mm using 2.0% pH 3-10 Isodalt Servalytes (Serva, Heidelberg, Germany) for 20,000 volt-hrs. One ug (PVDF) or 100 ng (silver) of an IEF internal standard, tropomyosin, was added to each sample. This protein migrates as a doublet with lower polypeptide spot of MW 33,000 and pI 5.2; an arrow on the stained gels marks its position. The enclosed tube gel pH gradient plot for this set of Servalytes was determined with a surface pH electrode.

After equilibration for 10 min in buffer "O" (10% glycerol, 50mM dithiothreitol, 2.3% SDS and 0.0625 M tris, pH 6.8), each tube gel was sealed to the top of a stacking gel that overlaid a 10% acrylamide slab gel (1.0 mm thick). SDS slab gel electrophoresis was carried out for about 5 hrs at 25 mA/gel. The following proteins (Sigma Chemical Co., St. Louis, MO) were used as molecular weight standards: myosin (220,000), phosphorylase A (94,000), catalase (60,000), actin (43,000) carbonic anhydrase (29,000) and lysozyme (14,000). These standards appear as bands at the basic edge of the silver-stained (Oakley, B.R., Kirsch, D.R. and Moris, N.R. *Anal. Biochem.* 105:361-363, 1980) 10% acrylamide slab gels. The gels were dried between sheets of cellophane paper with the acid edge to the left.

After slab gel electrophoresis, the gel for blotting was placed in transfer buffer (10 mM CAPS, pH 11.0, 10% methanol) and transblotted onto PVDF membranes overnight at 225 mA and approximately 100 volts/ two gels. The same proteins (Sigma Chemical Co., St. Louis, MO) were used as molecular weight standards: myosin (220,000), phosphorylase A (94,000), catalase (60,000), actin (43,000) carbonic anhydrase (29,000) and lysozyme (14,000). These standards appear as bands at the basic edge of the Coomassie Brilliant Blue R-250-stained membrane.

Western Blotting Methods

The blot was stained with Coomassie Brilliant Blue R-250 and desktop scanned. The blot was blocked for two hours in 5% Carnation Nonfat Dry Milk (NFD) in Tween-20 tris buffer saline (TTBS) and rinsed in TTBS. The blot was then incubated in primary antibody (Goat anti-*E. coli* [Cygnus Cat. # AP117 and Lot # 99] diluted to 0.5 µg/ml in 2% NFD TTBS) overnight and rinsed 3 x 10 minutes in TTBS. The blot was then placed in secondary antibody (Anti Goat IgG-HRP [Sigma Cat. # A5420 and Lot # 090M4822] 1:10,000 diluted in 2% NFD) for two hours, rinsed in TTBS as above, treated with ECL, and exposed to x-ray film (1 minute, 3 minute, and 10 minute exposures).

Computerized Comparisons

Western blot films (1 minute and 3 minute exposures) and duplicate silver-stained gels were obtained from the sample and scanned with a laser densitometer (Model PDSI, Molecular Dynamics Inc, Sunnyvale, CA). The scanner was checked for linearity prior to scanning with a calibrated Neutral Density Filter Set (Melles Griot, Irvine, CA). The images were analyzed using Progenesis Same Spots software (version 4.5, 2011, Nonlinear Dynamics, Durham, NC) and Progenesis PG240 software (version 2006, Nonlinear Dynamics, Durham, NC). The general method of computerized analysis for these pairs included image warping in conjunction with detailed manual checking. The lighter exposure of the western blot films was used to aid in spot matching for the overexposed areas of the darker exposure. Spots detected with the antibody were added to the master spot set even if not detectable by silver staining.

MW and pI Measurements

Note that the isoelectric point (pI) measurements are approximate being based on the pH gradient plot found on the next page for this batch of ampholines for conditions of 9M urea and room temperature of 22°C. Since the samples themselves may perturb the pH gradient, internal pI standards should be included if more exact pI measurements are required. The molecular weight and pI values for each spot are determined from algorithms applied to the reference image.

pH Gradient Plot LF 3-10 Iso-dalt

Name: Kendrick Laboratories, Inc.

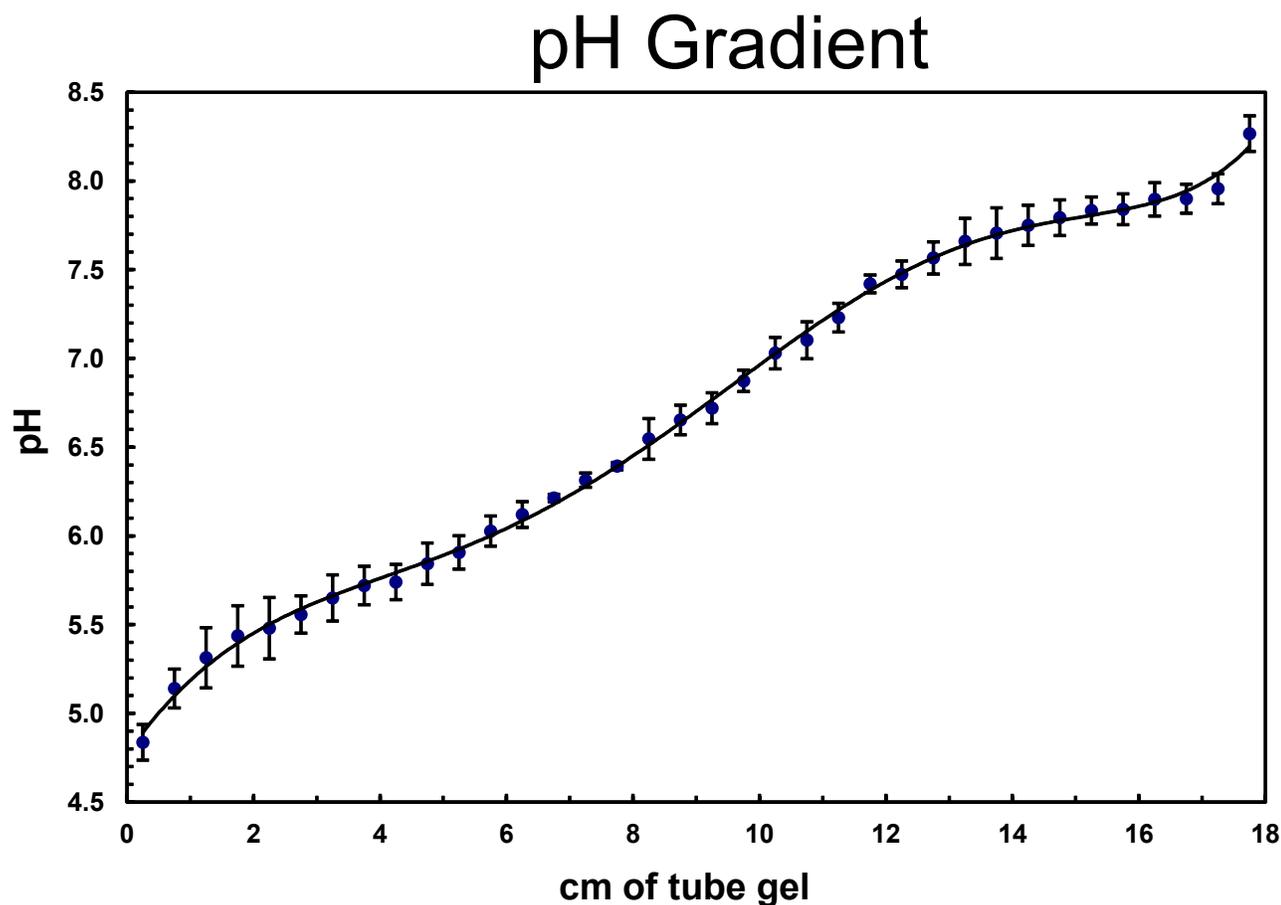

Date: 3/5/2014

Sample(s): K12 MG1655 *E. coli*

Ampholines: 2% pH 3-10 Iso-dalt Servalytes

Conditions of IEF: 20,000 VHrs. (20 Hrs. at 1,000 V)

Comments:

This pH gradient was measured using a surface pH electrode for 6 blank IEF tube gels.

The dried slab gel for the second dimension is 20 cm wide with a 2D pattern about 18.5 cm wide. If SDS has been added to the sample, an SDS-NP-40 micelle migrates to the extreme acid end of the tube gel, constricting the pH gradient. In this case, the tube gels are poured long and the SDS bulb is cut off and discarded. The dried 2D pattern for samples containing SDS is also about 18 cm wide.

The black arrow on your 2D gel indicates our internal standard, Tropomyosin, pI 5.2 and molecular weight 32,700. The molecular weight standard lines are due to myosin (220,000), phosphorylase A (94,000), catalase (60,000), actin (43,000), carbonic anhydrase (29,000), and lysozyme (14,000) which have been added to the sealing agarose.
